

# GEOMETRY - Part 1

segmental lines, planes, geometric formulas

## GEOMETRY HISTORY

Geometry means earth measurement. Early people used their knowledge of geometry to build roads, temples, pyramids, and irrigation systems. The more formal study of geometry today is based on an interest in logical reasoning and relationships rather than in measurement alone. Euclid (300 B.C.) organized Greek geometry into a 13-volume set of books named *The Elements*, in which the geometric relationships were derived through deductive reasoning. Thus, the formal geometry studied today is often called Euclidean Geometry. This geometry is also called plane geometry because the relationships deal with flat surfaces. Geometry has undefined terms, defined terms, postulates (assumptions that have not been proven, but have "worked" for thousands of years), and theorems (relationships that have been mathematically and logically proven).

## GEOMETRIC FORMULAS

**Perimeter:** The perimeter,  $P$ , of a two-dimensional shape is the sum of all side lengths. **Area:** The area,  $A$ , of a two-dimensional shape is the number of square units that can be put in the region enclosed by the sides. **Diagonal:** Area is obtained through some combination of multiplying heights and bases, which always form 90° angles with each other, except in circles. **Volume:** The volume,  $V$ , of a 3-dimensional shape is the number of cubic units that can be put in the region enclosed by all the sides.

**Square Area:**Area of both  $b$ -width and  $b$ -height, as all sides are equal in a square, then:  $A=b^2$  square units**Rectangle Area:**Area, or  $A=lb$ , if  $b=4$  and  $l=12$  then:  $A=48$  square units $A=(4)(12)$ , which square units**Triangle Area:**Area  $\frac{1}{2}bh$ , if  $b=8$  and  $h=12$  then:  $A=\frac{1}{2}(8)(12)$ ,  $A=48$  square units**Parallelogram Area:**Area of both  $b$ -width and  $b$ -height:  $A=bh$ ,  $A=(12)(8)$ ,  $A=96$  square units**Trapezoid Area:** $A=\frac{1}{2}(b_1+b_2)h$ , if  $b_1=2$ ,  $b_2=8$ ,  $h_1=8$  and  $h_2=12$  then:  $A=\frac{1}{2}(2+8)(8+12)$ ,  $A=\frac{1}{2}(10)(20)$ ,  $A=100$  square units**Circle Area:** $A=\pi r^2$ , if  $r=3$ ,  $\pi=3.14$  and  $\pi=3$  then:  $A=\pi(3^2)$ ,  $A=9\pi$  square units**Pythagorean Theorem:**If a right triangle has hypotenuse  $c$  and sides  $a$  and  $b$ , then  $c^2=a^2+b^2$ **Rectangular Prism Volume:** $V=lwh$ , if  $l=12$ ,  $w=3$  and  $h=4$  then:  $V=(12)(3)(4)$ ,  $V=144$  cubic units**Cube Volume:** $V=a^3$ , each edge length,  $a$ , is equal to the other edge in a cube, if  $a=8$  then:  $V=(8)(8)(8)$ ,  $V=512$  cubic units**Cylinder Volume:** $V=\pi r^2h$ , if radius  $r=3$  and  $h=8$  then:  $V=\pi(3^2)(8)$ ,  $V=72\pi$  cubic units**Cones Volume:** $V=\frac{1}{3}\pi r^2h$ , if  $r=3$  and  $h=8$  then:  $V=\frac{1}{3}\pi(3^2)(8)$ ,  $V=24\pi$  cubic units**Triangular Prism Volume:** $V=\frac{1}{2}bhsl$ , if  $b=4$ ,  $h=3$ ,  $s=5$  and  $l=8$  then:  $V=\frac{1}{2}(4)(3)(5)(8)$ ,  $V=240$  cubic units**Rectangular Pyramid Volume:** $V=\frac{1}{3}bhl$ , if  $b=4$ ,  $h=3$  and  $l=4$  then: the rectangle has an area of 12, then:  $V=\frac{1}{3}(12)(4)$ , and if  $h=5$  then:  $V=\frac{1}{3}(12)(5)$ ,  $V=20$  cubic units**Sphere Volume:** $V=\frac{4}{3}\pi r^3$ , if radius  $r=3$  then:  $V=\frac{4}{3}\pi(3^3)$ ,  $V=36\pi$  cubic units

## DESCRIPTIONS OF UNDEFINED TERMS

### Point

A. A point may be described as a location with no length, no width, and no depth.  
B. A point is always named with a capital letter; it is usually located by using a dot about the size of a period, although true points cannot really be drawn because they have no dimensions.  
For Example:  $A$  (indicates point  $A$ )

### Line

A. A line may be described as a set of points going straight on forever in two opposite directions; lines are straight and never end; there is never a need to use the phrase "straight line" because lines are straight; if something is not straight it cannot be a line, but might be a curve instead; lines have length, but no width and no depth; lines cannot be truly drawn, because they lack width and depth; representations of lines are drawn with arrows at each end indicating that the line has no end.  
B. Lines are usually named in one of two ways; the line containing points  $K$  and  $M$  may be named by either:

1. Using any 2 (over 2) points more than 2) points on the line with a line indicator above the points, for example:  $KM$  or  $MK$  (the order of the points doesn't matter); the line indicator above the capital letters always points horizontally from side to side and never any other direction; it is the actual location of that points in space that determines the location and direction of the real line, not the direction of the line indicator above the capital letters in the notation; or  
2. By using the lower case script letter  $\ell$  with a number subscript, for example:  $\ell_1$  or  $\ell_2$ .

**Note:** In coordinate geometry, points are the assigned coordinates, and, as a result, signatures of lines can be determined. (See Algebra - Part 2)

### Planes

A. A plane may be described as a set of points going on forever in all directions, except any direction that crosses depth; imagine the very surface of a perfectly flat piece of paper extending on forever in every direction, but having no thickness at all; the result would be a situation such that when any two points on this plane are connected by a line, all points on that line are also in the plane; planes have length and width, but no depth.  
B. Planes are simply referred to as "plane  $uv$ " or "plane ABC" (any three points on the plane that are not on the same line) or "the plane containing  $\ell$  (whatever points are the direction of  $\ell$ )"; planes cannot be drawn; representations of planes are usually drawn as parallel lines, either with the arrows indicating that the points go on forever or without the arrows even though the points do go on forever.

### Postulates

Postulates are statements that have been used and accepted for centuries without formal proof; these are generalities:

A. A line contains at least two points, and any two points locate exactly one line.

B. A plane contains at least three points that are not all on the same line, and any three points that are not on the same line locate exactly one plane; therefore, a line and one point not on the line also locate exactly one plane.

C. Any three points locate at least one plane.

One plane when the three points are not on the same line  
More than one plane when the three points are on the same line  
D. If two points off a line are in a plane, then the line is in the plane; or, if two points are in a plane, then the line containing the two points is also in the plane.

E. If two planes intersect, then their intersection is a line.

Plane  $uv$  and plane  $vw$  intersect in  $uv$

## DEFINED TERMS

There are many defined terms of plane geometry; the definitions of these terms will be given by topic groups throughout the study guide rather than grouped in one big list.

**Note:** Postulates (or axioms) are relationships and statements that have worked for centuries and are accepted without mathematical proof; theorems are relationships and statements that have been proven mathematically; postulates and theorems are given throughout this guide; they also are stated under the various topics of geometry; sometimes they are labeled as postulates or theorems, and sometimes they are simply stated and not labeled.

### Space

Refers to the set of all points; space goes on forever in every direction, and therefore has length, width and depth; space has no special notations; it is simply referred to as space; space contains at least four points that are not all on the same plane.

### General Terms

A. If two congruent shapes are the same shape and size; therefore, after some movement off the shapes they can be made to fit exactly on top of one another.

**Note:** Corresponding parts of congruent polygons are congruent; that is, since the polygons have been moved around to match up perfectly, their parts that match (correspond) are congruent.

Some modern applications are included. The contents are mainly devoted to topology the main field of Robert Gilmore's works in dynamical systems. They include a review on the topological analysis of chaotic dynamics works done in the past as well as the very latest issues. Most of the contributors who published during the 90's including the very well known scientists Otto Rössler, René Lozi and Joan Birman have made a significant impact on chaos theory, discrete chaos and knot theory respectively. Very few books cover the topological approach for investigating nonlinear dynamical systems. The present book will provide not only some historical, not necessarily widely known contributions about the different types of chaos introduced by Rössler and not just the Rössler attractor, but also Gumowski and Mira's contributions in electronics, Poincaré's heritage in nonlinear dynamics, but also some recent applications in laser dynamics, biology, etc.

Whether one knows it or not, just about everything that is seen and felt throughout the day involves some kind of math. The study of geometry can give students a better understanding of how buildings, furniture, vehicles and other infrastructural models are designed and built. Everything that is created and built around us has involved some kind of geometry. A geometric formulas study guide can help students to not only understand the formulas but also to retain them within their memories to make solving problems and understanding a much easier task. **Journal of Engineering Mechanics** , 2000 *English Mechanic and Mirror of Science* , 1912 **Geometric Formulas (Speedy Study Guide)** Speedy Publishing, 2014-11-26 A great assist in learning Geometry is a Formula study guide. Any student will find a study guide useful. Study guides should be clear and concise, grouping different functions in one area. For example, a Geometric Formula study guide would have groups based on lines, angles or polygons. Each item of the group should have a basic definition and the formulas related to the specific subsections such as a right angle. Study guides are a great way to quickly access important information. *National Union Catalog*, 1982 , 1983 **A Collection of Technical Materials** , 1982
