

# Visual Basic® for Applications 2016 Introduction

Visual Basic for Applications (VBA) is the programming language, or code, used to customize tasks in Microsoft Office applications. You can manually create your own VBA code or宏 (macro) created for you by recording actions. In either case, this code is placed "back" to repeat tasks, which, when sharing together, form the **subroutine** or **procedure**.

## Showing the Developer Tab

Always display the DEVELOPER tab, as it provides quick access to macros, VBA code and related security settings.

1. Choose FILE, OPTIONS, then Click ADVANCED.
2. Under the CUSTOMIZE THE RIBBON checkbox in the right side of the CUSTOMIZE THE RIBBON column, click DEVELOPER.

## Setting Macro Security

1. Choose DEVELOPER, then Macro Security.
2. Choose one of the MACRO SETTINGS, then (Click) OK.

Tip: Use the Enable all Macros option when working on your own code.

## Organizing VBA Projects

The VBA editor, contained within each Office application, is used to create and organize VBA code. It's left-side Project Explorer pane lists, in tree-style view, all Projects, representing the user's Office files, plus associated Objects or Module Projects.

- The Objects Folder lists any open file's documents, **(See Microsoft Word Objects)**.
- The Modules Folder lists modules, filled with user-created VBA code.
- The code is displayed in a larger pane to the right.
- Code created for a document only applies to that document, while module code applies to any document in the project.

1. Press <ALT-F11> or

2. Open the left-side Project Explorer pane, if necessary, with **VIEW, PROJECT EXPLORER** or <QAT>.

## Opening or Creating Code Windows

1. (Double-Click) any Project Explorer item to open its code window. If necessary, first open its containing document by (Selecting) the **Document**.
2. (Right-Click) any Project Explorer item and choose **INSERT, MODULE** to create a new module.

Project Explorer's tree view is different for each Office application. For example, PowerPoint has no Objects folder, while Excel has a separate object for each worksheet. The naming convention is:

- Excel: Project name = Workbook name or Personal.xls, Objects name = Workbook name.

- Word: Project name = Document name or Normal Objects name = ThisDocument.
- Access: Project name = Database file name, Objects name = Name of form or report.
- PowerPoint: Project name = PowerPoint file name.
- Modules and module subfolders are named Module1, 2, 3, ...

## Deleting a Code Window

1. (Right-Click) an object or module name in Project Explorer and select REMOVE (Module named ...).
2. (Click) NO from the pop-up message unless you want to import the code for re-linking.

## Creating VBA Code

1. Open an existing code window or add a new module.
2. Position the cursor at the code insertion point, of new code, and choose **INSERT, MACRO/PROCEDURE**.
  - a. Enter a NAME (See Code Name Rules).
  - b. Select **CODE** to automatically insert with a SubProcedure, or **MACRO** to perform macroized calculations.
  - c. Select **PROTECTED** to make your code publicly accessible to any subordinates. PROTECTED will restrict its use to the subroutine being created or modified.
  - d. Select "Set local variables to [Macro]" to assign the value of the parameter's variables after code compilation ends (e.g., **Sub** is a naming macro).
  - e. (Click) OK.
3. Enter your code in an organized way (See Organizing Code).
4. Choose FILE, SAVE, then **Save** Code.

Tip: Save your writing code in Excel or Word by recording it from an object, then applying the recorded code to your module.

## Running VBA Code Manually

1. Choose DEVELOPER, MACROS.
2. (Click) the subroutine name in the **Macro/Proc List**, if the list is too long, restrict it to a specific location from the **PROCEDURE** list.
3. (Click) one of four buttons on the right side: RUN - Runs the code by execution. STOP - Runs one code line at a time in the order you can see. For details, see Breakpoint setting. EDIT - Displays the subroutine. DELETE - Deletes the subroutine. OPTIMIZE - Useful for creating a keyboard shortcut to run the subroutine.

## Automatically

VBA subroutines can be triggered by events, run by other subroutines, or start when an Office program starts.

- See [Macros](#) involving the VBA language, **Using Code Windows**, and **Visual Basic Editor** for examples of event triggering.
- Add the code **Sub** *Event* **End Sub** to the *Normal* subroutine from within another subroutine.
- To automatically run code when opening a document or workbook, create a subroutine called **Document\_Open** in Excel's **ThisDocument** code, **Sub**routine, or a subroutine called **Workbook\_Open** in Excel's **ThisWorkbook** code subroutine.

Tip: To run a subroutine automatically when an access database opens, use the steps listed in [Using Macros in Access Databases](#).

## Saving Code

Code can only be saved by saving the Office file it's stored in. Double-Click the project for Excel, Word or PowerPoint (e.g., **Document1**, **Normal**) to edit the entire document. Then click the **SAVE** button, then the **PROCEDURE** list at the top of the **Normal**'s code window. All subroutines are automatically created called **Sub** *Form* (For example, **Document1**, **Normal**, **Normal** validation code) and it will run just before the *Normal*'s contents are saved.

1. Choose FILE, SAVE, or press <Ctrl-S>.
2. If a "Macro/Proc" warning message appears, (Click) NO.
3. Choose **FILE, EXIT** to **Microsoft Word** (if there's a part of it).

4. Choose a location, specify a FILE NAME, then (Click) **SAVE**.

## Sharing VBA/Excel

Macros recorded in Excel or Word can be used by another only in the current workbook/document, regardless of all other open documents. To use a recorded macro globally, choose the following from the **EXCEL, MACROS** drop-down in the **RECORD MACRO/PROVIDE** dialog box:

- In Excel, choose **PERSONAL MACRO WORKBOOK**.
- In Word, don't change the default **ALL DOCUMENTS** (EXCEL, EXCEL macro).
- If this code can only be used globally, it is usually created under the **PERSONAL** project in Word or the **PERSONAL** VBA project in Excel.

## Code Name Rules

- Code names must begin with a letter.
- Subsequent characters should only be letters, numbers, or underscores or dashes.
- Good practice makes names shorter than 25 characters, and substitutes underscores for spaces.
- Avoid names that are the same as code references, in fact or restricted VBA keywords such as **FUNCTION**.

## VBA Editor Tips

- The Project Explorer pane is best used to navigate between code windows.
- Use the code editor's Procedure drop-down menu **Macro/Procedure** to navigate between subroutines in a long code window.
- (Click) the Project Explorer Folder icon at the top of the pane to toggle between a grouped list (Folders) and a straight list. Making this change in any one Office application will affect all Office applications.
- To maximize the code window, clear all other windows and panes.
- To directly edit a macro in Excel or Word, press <ALT-F11>, select the macro name, then **EDIT**.
- Press <Alt-Q> to close the VBA Editor and return to its Office application.

## Using Code Window Lists

Object List Procedure List

The Object and Procedure drop-downs at the top of any code window. They can be used to navigate between subroutines or create second-triggered code.

1. Select an appropriate item from the Object drop list.
2. Then select an appropriate item from the Procedure drop list.
3. Write code into the newly created subroutine. For example, a subroutine can be created to validate Access Form data, with recorded validation required before the form's saved. Select the **Normal** project from the PROCEDURE list at the top of the **Normal**'s code window. All subroutines are automatically created called **Sub** *Form* (For example, **Document1**, **Normal**, **Normal** validation code) and it will run just before the *Normal*'s contents are saved.

## Navigating Code Window Lists

### Object List Themes

**GENERAL**: Displays all existing subroutine and function procedures.

**WORKSHEET** or **WORKBOOK**: Displays code for the selected local worksheet or workbook.

**DOCUMENT**: Displays code for a selected Word document.

**ACCESS** or **EXCEL**: Displays code for the Access object or sub-object within the selected form or report.

### Procedure List Themes

**DECLARATION**: To jump to a code subroutine's Declaration, move above the first procedure.

**FUNCTION**: To create a procedure or an empty code that acts on the selected object.

**PROCEDURE**: To navigate to an existing procedure within a code window.

## Useful Keyboard Shortcuts

**Shift** + Hold this key down while opening an Office application and its AutoOpen code will be bypassed. **Ctrl-Shift** + Space: Run宏 code. This key combination is particularly useful in setting infinite loops.

**Shift-F2** : Displays the VBA Editor Object Browser definition of an object, method, or property selected in a code window.

**Alt-F9** : Displays a selected resource in Excel or Word.
