## **Inducing Genetic Change In Cancer Cells Using Lasers:**

**Inducing Genetic Change in Cancer Cells Using Lasers** Muhammad Waleed,2014-12-04 In this book we demonstrate a new single cell optoporation and transfection technique using femtosecond Gaussian laser beam and optical tweezers. Tightly focused near infrared NIR femtosecond laser pulse was employed to transiently perforate the cellular membrane at a single point of MCF 7 cancer cell. A distinct technique is developed by trapping the microparticle using optical tweezers to focus femtosecond laser exactly on the cell membrane to puncture it for the desired time. Subsequently calculated amount of external gene was introduced in the cell by trapping and inserting same plasmid coated microparticle into optoporated cell using optical tweezers. Various experimental parameters such as femtosecond laser exposure power exposure time punctured hole size exact focusing of femtosecond laser and cell healing time were closely analyzed to optimize the best conditions for cell viability. Trapped particle position is detected by another co aligned continuous wave laser. In the end after insertion of plasmid coated microparticle the targeted cells exhibited green fluorescent protein GFP under the fluorescent microscope hence confirming successful genetic change.

**Diagnostic Optical Spectroscopy in Biomedicine** ,2001 Cumulated Index Medicus ,1989 **Laser Manipulation of Cells and Tissues** Michael W. Berns,Karl Otto Greulich,2007-06-20 The use of laser based manipulation tools has literally exploded on the cell biology and molecular pathology scene resulting in as many different laser micromanipulation systems as there are people using them. Laser Manipulation of Cells and Tissues ties all these systems and studies together describing all of the different kinds of research and practical analytical applications of laser manipulation. It also provides the reader with the basic information needed to actually build one's own laser micro manipulation system. The combination of imaging and molecular probe technology with laser micromanipulation greatly extends the use of this technology in molecular cellular developmental and pathobiology medicine. This book should be valuable to scientists, clinicians and students in the fields of cell and developmental biology, cell physiology, cancer biology, pathology and stem cell biology. Devotes four chapters to laser catapulting and capture of DNA and other cellular material for biochemical analysis, a major use of this technology that has been adapted for molecular pathology both in clinical medicine and research. Discusses the theory of laser tweezers, optical tweezers and its application to novel problems in biology. Covers topics on optoporation, getting things into cells, uncaging of molecules and the ability to collect and analyze nanomolar amounts of cell material by

an array of biochemical physical tools of particular interest to cell biologists and drug discovery researchers
