**Exercise, Energy Balance, and Cancer** Cornelia M. Ulrich, Karen Steindorf, Nathan A. Berger, 2012-10-10 While it is well established that the worldwide pandemic of overweight and obesity has profound effects on promoting cancer it is now recognized that an alternative aspect of energy balance namely physical activity and exercise have significant beneficial effects on all aspects of cancer across the spectrum from prevention through treatment and extending through survivorship Moreover salutary effects of physical activity and exercise extend across the age span from youth to old age and occur at all stages of cancer extending into palliative care While the effect of physical activity and exercise on cancer may be partially mediated through obesity control it is clear that considerable research is required and is ongoing at both the molecular and clinical levels to better understand the associated mechanisms and to develop optimal exercise strategies This volume will contain chapters on the effect of exercise on biological pathways in tumor growth state art exercise strategies and cutting edge research focused on different cancers and patient groups It will provide an important volume in this series on energy balance and cancer and a basis for ongoing research experimental approaches and application of evidence based practices to clinical care for patients with cancer

multidisciplinary group presents the evidence and provides the recommendations The antidote to diseases of inertia is movement let's move John Potter M D Ph D from the Foreword The American Cancer Society estimates that a third of all cancer deaths could be prevented through avoidance of obesity and the rejection of sedentary lifestyles The World Health Organization also supports this claim Additionally these and other organizations now recognize the role that activity can play in improving the quality of life for cancer patients Cancer Prevention and Management through Exercise and Weight Control provides us with the support necessary to make a call to action It brings together the contributions of world class researchers to lay out the evidence and a plan of attack for coping with this crisis The text begins by focusing on the research methods used in assessing the complex associations between activity energy balance and risk and prognosis In comprehensive literature reviews the authors consider the role of physical activity in the incidence of individual cancers then explore the mechanisms that might explain this connection They continue with a look at the relation between weight and cancer incidence including a consideration of genetics Research is also provided linking physical activity and weight control to a

cancer patient's quality of life and prognosis. The work concludes with ideas on how a plan of action might be implemented at the individual clinical and public health levels.
