How and Why Artificial Intelligence Influences Johnny Ch LOK,2020-05-22 I suppose that productivity can be raised What are the impacts of robots on employment Firstly the main focus of development has been on personal entertainment which does not drive worker productivity manufacturing production When the internet information and communication technology ICT innovation This is borne and by findings that

manufacturing productivity which has been driven by innovations in automation rather than consumer technologies has government strongly than productivity in the services sectors of the economy in most nature economies It seems AI automation will create many jobs in internet communication entertainment game industry For example many young people like to use internet to play any electronic games from computer or mobile at home or outside home conveniently Thus AI automation will increase demand to be invented to any new entertainment game from internet channel It will need to employ many AI entertainment game inventors to create many automation entertainment games Thus AI automation in internet entertainment game industry will need human AI entertainment game inventors to invent the knowledge based capital of AI automation entertainment games The AI entertainment game inventors will need own research and development skills form specific skills organizational know how skills databased knowledge design and various forms of intellectual property to do these AI automation entertainment game invention occupations in the future International Federation Of Robotics 2016 indicated that China will be as a major robotics manufacturer and user of robots benefiting from jobs created by robot manufacturing and productivity gains from robot use Chins had sold of robots to any one single market every year since 2017 year The Chinese government has included a focus on robotics in its 10 year strategy In order to achieve its target of a robot density of 150 units per 10 000 workers by 2020 year Thus Chinese companies will have to install around 650 000 new industrial robots between 2016 to 2020 year 2.5 times more than installed globally in 2015 year Hence China AI manufacturing industry will need to employ many workers It implies AI manufacturing industry will create many new occupations in China Also ministry of economy trade and industry 2015 also showed that Japan currently has the largest stock of industrial robots in operations primarily in the automation industry Driven by a rapidly aging population and low productivity rates the Japanese government has sights on a 20 fold increase in the use of robots in the non manufacturing sector and a three fold growth rate of labor productivity in the service sector both by 2020 year Thus it also implies Japan will need many robots to be provide to service industry Due to robots will provide to serve any businessmen s clients Thus it is possible that the service workers won t be dismissed as well as it is depended on the serving job nature to decide whether Japan s service workers can still serve to their employer when the service AI robots are applied to whose employers Consequently it seems that AI can create employment Ministry of economy trade and industry 2015 showed that such as China will develop the major AI automation manufacturing industry The AI employers will need to employ many workers to manufacture any these different kinds of AI robots to satisfy China or overseas individual or business buyers needs But AI can also cause unemployment to the low skillful service workers Such as if Japan some service businesses choose to buy any AI service robots to replace their service staffs to serve their clients It is possible that the service staffs will be dismissed due to AI robots can do such as their same service job duties to achieve better service performance **[Non] Human**
