Spellman, Nancy E. Whiting, 2006-06-02 This newly updated reference uses scientific laws principles models and concepts to provide a basic foundation for understanding and evaluating the impact that chemicals and technology have on the environment Designed for both professional and student use the new Second Edition includes recent

improvements in the application of new technologies and materials on the environment. It places greater emphasis on the three environmental media of air, water, and soil and discusses how technology can be used to mitigate contamination of all three. This edition has been made even more user friendly by communicating with more environmental terms and fewer scientific ones. Major topics covered include connections between environmental science and technology, air quality, water quality, soil science, and the impact of solid and hazardous waste on the environment. Each chapter includes a list of objectives, discussion questions, and a bibliography for further research.

Physicochemical Treatment Processes Lawrence K. Wang, Yung-Tse Hung, Nazih K. Shamas, 2007-11-13. The past 30 years have seen the emergence of a growing desire worldwide to take positive actions to restore and protect the environment from the degrading effects of all forms of pollution: air, noise, solid waste, and water. Because pollution is a direct or indirect consequence of waste, the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste. However, as long as waste exists, we can only attempt to abate the subsequent pollution by converting it to a less noxious form. Three major questions usually arise when a particular type of pollution has been identified: 1. How serious is the pollution? 2. Is the technology to abate it available? and 3. Do the costs of abatement justify the degree of abatement achieved? The principal intention of the Handbook of Environmental Engineering series is to help readers formulate answers to the last two questions. The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control. However, realization of the ever increasing complexity and interrelated nature of current environmental problems makes it imperative that intelligent planning of pollution abatement systems be undertaken.
