Systematic Transformation Method from UML to Event-B Zou Sheng-Rong, Geng Xue, Yao Ju-Yi, Liu Xiao-Ying, Zhi Yu-Hua, 2024-06-05 Since the emergence of software engineering in the late 1960s requirements analysis has always been an important theme of software development In the process of software development many people are needed to cooperate to ensure the stability and reliability of the software According to the degree of formalization in the software development process software engineering methods can be divided into three types non formal semi formal and formal In object oriented software development UML has become a de facto modeling standard However although UML is intuitive and easy to understand and apply it has inaccurate semantics and UML is a semi formal modeling language that cannot be formally verified Event B is a formal method based on a large number of mathematical predicate logic which is accurate but difficult to understand and apply Therefore how to combine the advantages of UML diagrams and Event B methods is the focus of research

Product Lines with UML shows how to employ the latest version of the industry standard Unified Modeling Language UML 2.0 to reuse software requirements and architectures rather than starting the development of each new system from scratch. Through real world case studies the book illustrates the fundamental concepts and technologies used in the design and implementation of software product lines. This book describes a new UML based software design method for product lines called PLUS Product Line UML based Software engineering. PLUS provides a set of concepts and techniques to extend UML based design methods and processes for single systems in a new dimension to address software product lines. Using PLUS the objective is to explicitly model the commonality and variability in a software product line. Hassan Gomaa explores how each of the UML modeling views use case static state machine and interaction modeling can be extended to address software product families. He also discusses how software architectural patterns can be used to develop a reusable component based architecture for a product line and how to express this architecture as a UML platform independent model that can then be mapped to a platform specific model. Key topics include Software product line engineering process which extends the Unified Development Software Process to address software product lines. Use case modeling including modeling the common and variable functionality of a product line. Incorporating feature modeling into UML for modeling common optional and alternative product line features. Static modeling including modeling the boundary of the product line and information intensive entity classes. Dynamic modeling including using interaction modeling to address use case variability. State machines for modeling state dependent variability. Modeling class variability using inheritance and parameterization. Software architectural patterns for product lines. Component based distributed design using the new UML 2.0 capability for modeling components connectors ports and provided and required interfaces. Detailed case studies giving a step by step solution to real world product line problems. Designing Software Product Lines with UML is an invaluable resource for all designers and developers in this growing field. The information technology and case studies presented here show how to harness the promise of software product lines and the practicality of the UML to take software design quality and efficiency to the next level.
