Committee on Appropriations, 1968 Epoxy Adhesive Formulations Edward Petrie, 2005-09-09 Unmodified epoxy resins cause certain problems for both the adhesive formulator and end user They are often rigid and brittle hence impact resistance and peel strength are poor For decades Chemist have been vigorously working to minimize these major shortcomings Based on a popular course sponsored by the Society of Plastics Engineers and written by an authority in the field this comprehensive text presents a variety of methods to accomplish what up to now has been a formidable task Beginning with epoxy chemistry moving on to fillers filler treatments and surfactants and ending with current and future development in formulating Epoxy Adhesives this rigorous text addressed the problem of improving flexibility durability and strength by adding chemical groups to the epoxy structure either via the base resin or the curing

agent or by adding separate flexibilizing resins to the formulation to create an epoxy hybrid adhesive **Hearings, Reports and Prints of the Senate Committee on Appropriations** United States. Epoxy is a term used to denote both the basic components and the cured end products of epoxy resins as well as a colloquial name for the epoxide functional group. Epoxy resin is a class of thermoset materials used extensively in structural and specialty composite applications because they offer a unique combination of properties that are unattainable with other thermoset resins. Epoxies are monomers or prepolymers that further reacts with curing agents to yield high performance thermosetting plastics. They have gained wide acceptance in protecting coatings electrical and structural applications because of their exceptional combination of properties such as toughness, adhesion, chemical resistance and superior electrical properties. Epoxy resins are characterized by the presence of a three membered cyclic ether group commonly referred to as an epoxy group. 1,2-epoxide or oxirane. The most widely used epoxy resins are diglycidyl ethers of bisphenol A derived from bisphenol A and epichlorohydrin. The market of epoxy resins are growing day by day. Today the total business of this product is more than 100 crores. Epoxy resins are used for about 75% of wind blades currently produced worldwide while polyester resins account for the remaining 25%. A standard 1.5 MW megawatt wind turbine has approximately 10 tonnes of epoxy in its blades. Traditionally the markets for epoxy resins have been driven by demand generated primarily in areas of adhesives, building and civil construction, electrical insulation, printed circuit boards and protective coatings for consumer durables amongst others. The major contents of the book are synthesis and characteristics of epoxy resin, manufacture of epoxy resins, epoxide curing reactions, the dynamic mechanical properties of epoxy resins, physical and chemical properties of epoxy resins, epoxy resin adhesives, epoxy resin coatings, epoxy coating give into water, electrical and electronic applications, analysis of epoxides and epoxy resins and the toxicology of epoxy resins. It will be a standard reference book for professionals and entrepreneurs. Those who are interested in this field can find the complete information from manufacture to final uses of epoxy resin. This presentation will be very helpful to new entrepreneurs, technocrats, research scholars, libraries and existing units.
