To the left is a framed picture of a girl. The overall scene is bright and cheerful.

practices that are mainly postulated at a bodily brain level of description and analysis The phenomenological exploration typically targets descriptions of persons lived experience For instance patients suffering from schizophrenia may describe their thoughts as alien thoughts are intruding into my head and the world surrounding them as fragmented the world is a series of snapshots Stanghellini et al 2015 The result is a rich and detailed collection of the patients qualitative self descriptions Stanghellini and Rossi 2014 that reveal fundamental changes in the structure of experiencing and can be captured by using specific assessment tools Parnas et al 2005 Sass et al 2017 Stanghellini et al 2014 The practice of considering the objective and the subjective levels of analysis as separated in the research studies design has many unintended consequences Primarily it has the effect of limiting actionable neuroscientific progress within clinical practice This holds true both in terms of availability of evidence based treatments for the disorders as well as for early diagnosis purposes In response to this need this collection of articles aims to promote an interdisciplinary endeavor to better connect the bodily objective level of analysis with its experiential corollary This is accomplished by focusing on the convergence between neuro physiological evidence and the phenomenological manifestations of anomalous bodily experiences present in different disorders
