Circuit-Technology Co-Optimization of SRAM Design in Advanced CMOS Nodes Hsiao-Hsuan Liu,Francky Catthoor,2024-12-20 Modern computing engines CPUs GPUs and NPUs require extensive SRAM for cache designs driven by the increasing demand for higher density performance and energy efficiency This book delves into two primary areas within ultra scaled technology nodes 1 advancing SRAM bitcell scaling and 2 exploring innovative subarray designs to enhance power performance area

PPA metrics across technology nodes. The first part of the book utilizes a bottom up design technology co optimization DTCO approach employing a dedicated PPA simulation framework to evaluate and identify the most promising strategies for SRAM bitcell scaling. It offers a comprehensive examination of SRAM bitcell scaling beyond 1 nm node outlining a structured research cycle that includes identifying scaling bottlenecks developing cutting edge architectures with complementary field effect transistor CFET technology and addressing challenges such as process integration and routing complexities.

Additionally this book introduces a novel write margin methodology to better address the risks of write failures in resistance dominated nodes. This methodology accounts for time dependent parasitic bitline effects and incorporates timing setup of write assist techniques to prevent underestimating the yield loss. In the second part the focus shifts to a top down DTCO approach due to the diminishing returns of bitcell scaling beyond 5 nm at the macro level. As technology scales increasing resistance and capacitance RC lead designers to adopt smaller subarray sizes to reduce effective RC and enhance subarray level PPA. However this approach can result in increased inter subarray interconnect overhead potentially offsetting macro level improvements. This book examines the effects of various subarray sizes on macro level PPA and finds that larger subarrays can significantly reduce interconnect overhead and improve the energy delay area product EDAP of SRAM macro.

The introduction of the active interconnect AIC concept enables the use of larger subarray sizes while integrating carbon nanotube FET as back end of line compatible devices results in macro level EDAP improvements of up to 65% when transitioning from standard subarrays to AIC divided subarrays. These findings highlight the future trajectory of SRAM subarray design in deeply scaled nodes.

For emerging market and developing economies EMDEs the ability to boost job creation and reduce extreme poverty has declined. Key downside risks include a further escalation of trade barriers and continued policy uncertainty. These challenges are exacerbated by subdued foreign direct investment into EMDEs.
