

TRANSFORMER PROTECTION

Article 450-3 of the National Electrical Code and Rule 26-254 of the Canadian Electrical Code cover overcurrent protection of transformers. Some of the requirements are summarized here.

Transformers - Primary 600 Volts or Less

If secondary fuse protection is not provided, primary fuses are to be selected according to Table 1. If both primary and secondary fuses are used, they are to be selected according to Table 2.

Table 1 - Primary Fuse Only

Transformer Primary Amperes	Maximum Primary Fuse % Rating
9 or More	125* (NEC) / 150* (CEC)
2 to 9	167
Less than 2	300

* May be increased to next higher std. fuse size.

Table 2 - Primary and Secondary Fuses

Transformer Secondary Amperes	Maximum % Rating		
	Primary Fuse		Secondary Fuse
	NEC	CEC	
9 or More	250	300	125*
Less than 9	250	300	167

*May be increased to next higher std. fuse size

Transformer Magnetizing Inrush Currents

When voltage is switched on to energize a transformer, the transformer core normally saturates. This results in a large inrush (magnetizing) current which is greatest during the first half cycle (approx. .01 second) and becomes progressively less severe over the next several cycles (approx. 0.1 second) until the transformer reaches its normal current.

To accommodate this inrush current, fuses are often selected which have time-current withstand values of at least 12 times transformer primary rated current for 0.1 second and 25 times for 0.01 second. Recommended primary fuses for popular, low-voltage 3-phase transformers are shown on the next page. Control circuit transformers may have substantially greater inrush currents. For these applications, the fuse should be selected to withstand 40 times transformer primary rated current for 0.01 second.
