**REINFORCEMENT LEARNING: FOUNDATIONS, ALGORITHMS AND APPLICATIONS** Dr. Dario Salguero

García, Deepti Razdan, Ismail Keshta, Dr. Haewon Byeon, 2023-09-18 Reinforcement learning sometimes known as RL is a catchall word that refers to both a learning problem and a subfield in machine learning. In the context of a problem involving learning this refers to the process of determining how to guide a computer toward an arbitrary numerical objective. The process of reinforcement learning may be seen in its usual application in the controller is provided with both the present state of the system under their control as well as the reward earned from the most recent transition. After that the system will calculate an answer and then provide it to you. Because of this the system goes through a state transition and the process starts all over again. Figuring out how to have the most possible impact on the system in order to get the greatest possible advantage from it is the task at hand here. The gathering of data and the measurement of performance are two areas in which the learning obstacles are distinct. In this context we make the assumption that the target system is by its very nature unpredictable. In addition we make the assumption that the measures of state that are now accessible are detailed enough so that the controller does not need to speculate on how to get state information. The Markovian decision processes often known as MDPs provide a helpful framework for modeling issues that include these characteristics. MDPs are often solved via the use of dynamic programming which in practice does nothing more than recast the initial problem as one involving the selection of an acceptable value function. Dynamic programming on the other hand is impractical in all but the most elementary of situations namely those in which the MDP has a limited number of states and actions. The RL algorithms that we give here may be seen as a method that can be utilized to turn unfeasible dynamic programming into usable algorithms that can be used to real world applications on a huge scale. The reason why RL algorithms are able to do this task is due to two key assumptions. The fundamental idea is to illustrate the dynamics of the control issue in a more concise way by utilizing samples. This is crucial for two reasons which are as follows. To begin it makes it easier to handle learning circumstances that include dynamics that are unknown.

**A Mathematical Theory of Design: Foundations, Algorithms and Applications**

D. Braha, O. Maimon, 2013-04-17 Formal Design Theory PDT is a mathematical theory of design. The main goal of PDT is to develop a domain independent core model of the design process. The book focuses the reader's attention on the process by which ideas originate and are developed into workable products. In developing PDT we have been striving toward what has been expressed by the distinguished scholar Simon 1969 that the science of design is possible and some day we will be able to talk in terms of well established theories and practices. The book is divided into five interrelated parts. The conceptual approach is presented first. Part I followed by the theoretical foundations of PDT. Part II and from which the algorithmic and pragmatic implications are deduced. Part III Finally detailed case studies illustrate the theory and the methods of the design.

process Part IV and additional practical considerations are evaluated Part V The generic nature of the concepts theory and methods are validated by examples from a variety of disciplines FDT explores issues such as algebraic representation of design artifacts idealized design process cycle and computational analysis and measurement of design process complexity and quality FDT's axioms convey the assumptions of the theory about the nature of artifacts and potential modifications of the artifacts in achieving desired goals or functionality By being able to state these axioms explicitly it is possible to derive theorems and corollaries as well as to develop specific analytical and constructive methodologies
