### Angles and Angle Measure

**Angles in Standard Position** An angle is determined by two rays. The degree measure of an angle in standard position is described by the amount and direction of rotation from the **initial side**, which lies along the positive  $x$ -axis, to the **terminal side**. A counterclockwise rotation is associated with positive angle measure and a clockwise rotation is associated with negative angle measure. Two or more angles in standard position with the same terminal side are called **coterminal angles**.

**Example 1:** Draw an angle with measure  $290^\circ$  in standard position.

The negative  $y$ -axis represents a positive rotation of  $270^\circ$ . To generate an angle of  $290^\circ$ , rotate the terminal side  $20^\circ$  more in the counterclockwise direction.

**Example 2:** Find an angle with a positive measure and an angle with a negative measure that are coterminal with each angle.

a.  $250^\circ$

A positive angle is  $250^\circ + 360^\circ$  or  $610^\circ$ .      Add  $360^\circ$ .  
 A negative angle is  $250^\circ - 360^\circ$  or  $-110^\circ$ .      Subtract  $360^\circ$ .

b.  $-140^\circ$

A positive angle is  $-140^\circ + 360^\circ$  or  $220^\circ$ .      Add  $360^\circ$ .  
 A negative angle is  $-140^\circ - 360^\circ$  or  $-500^\circ$ .      Subtract  $360^\circ$ .

#### Exercises

Draw an angle with the given measure in standard position.

1.  $160^\circ$

2.  $280^\circ$

3.  $400^\circ$

Find an angle with a positive measure and an angle with a negative measure that are coterminal with each angle.

4.  $65^\circ$

5.  $-75^\circ$

6.  $230^\circ$

7.  $420^\circ$

of cardiovascular disease The clinical value of patient specific modeling is well illustrated in application areas where model based interpretation of clinical images allows a more precise analysis of disease processes than can otherwise be achieved For example Chap 6 in this volume by Speelman et al deals with the very difficult problem of trying to predict whether and when an abdominal aortic aneurysm might burst This requires automated segmentation of the vascular geometry from magnetic resonance images and finite element analysis of wall stress using large deformation elasticity theory applied to the geometric model created from the segmentation The time varying normal and shear stress acting on the arterial wall is estimated from the arterial pressure and flow distributions Thrombus formation is identified as a potentially important contributor to changed material properties of the arterial wall Understanding how the wall adapts and remodels its material properties in the face of changes in both the stress loading and blood constituents associated with inflammatory processes IL6 CRP MMPs etc
