

## Transcription Practice Questions

It is important for keeping the genetic information stored in the DNA to reflect what is used in the cell. Transcription is the process by which RNA molecules are synthesized from DNA strands. This is the first step in the process of gene expression and the genetic information contained in DNA. The process of transcription is very similar for plant and animal cells.

Below, the non-transcribed strand of DNA is labeled 'the same DNA strand except that it is single-stranded'.

1. List the 3 types of RNA that are required to produce proteins: mRNA and tRNA and rRNA.

**Messenger RNA (mRNA):** Carries instructions from a gene to make a protein. Contains "message" DNA. In nucleus → ribosomes in cytoplasm

**ribosomal RNA (rRNA):** Part of the ribosomes. Ribosomes are complexes that make proteins.

**Transfer RNA (tRNA):** Transfers amino acids to the ribosomes to make a protein.

2. What is produced during transcription? \_\_\_\_\_ (RNA, DNA, or messenger) \_\_\_\_\_

3. Where does transcription take place? \_\_\_\_\_ nucleus \_\_\_\_\_
