Systems: Theoretical and Practical Perspectives on Metrics of Physiological Signal Complexity Sladjana
Spasić, Srdjan Kesić, 2019-06-28 The biological basis of physiological signals is incredibly complex While many types of
research certainly appreciate molecular cellular and systems approach to unravel overall biological complexity in the recent
decades the interest for mathematical and computational characterization of structural and functional basis underlying
biological phenomena gain wide popularity among scientists Nowadays we witnessed wide range applications of nonlinear
quantitative analysis that produced measures such as fractal dimension power law scaling Hurst exponent Lyapunov
exponent approximate entropy sample entropy Lempel Ziv complexity as well as other metrics for predictions of onset and
progression of many pathological conditions especially in the central nervous systems CNS In this Research Topic we seek to
bring together the recent practical and theoretical advances in the development and application of nonlinear methods or
narrower fractal based methods for characterizing the complex physiological systems at multiple levels of the organization
We will discuss the use of various complexity measures and appropriate parameters for characterizing the variety of
physiological signals up to the systems level There are multiple aims in this topic The recent advancement in the application
of nonlinear methods for both normal and pathological physiological conditions is the first The second aim is to emphasize
the more recent successful attempt to apply these methods across animal species Finally a comprehensive understanding of
advantages and disadvantages of each method especially between its mathematical assumptions and real world applicability
can help to find out what is at stake regarding the above aims and to direct us toward the more fruitful application of
nonlinear measures and statistics in physiology and biology in general **Whitaker's Five-year Cumulative Book List**
