Heat Shock Response in Escherichia Coli* Eric Gisbert,2006 All organisms utilize the heat shock response to sense the level  
of unfolded proteins in the cell and adjust the level of chaperones and proteases accordingly The regulation of the heat shock  
response has been extensively studied yet there are still unexplained components I report three contributions to our  
understanding of this regulation First I show that instead of a single chaperone a chaperone network consisting of at least  
DnaK J and GroEL S is used to sense unfolded proteins Second I provide evidence for an unexpected link between activity  
control and regulated degradation of sigma32 and suggest that an additional unidentified factor contributes to the regulation  
of sigma32 activity These results are based on analysis of sigma32 mutants defective in activity regulation Third I  
demonstrate that Hfq and potentially small RNA binding partners contribute to regulation of sigma32 in at least two distinct  
ways Hfq represses DnaK translation which in turn leads to an increase in sigma 32 activity Also Hfq participates in a  
process that we have termed long term adaptation whereby the activity of sigma32 recovers to normal levels following long

term chaperone overexpression    Engineering News ,1893    Improvement Bulletin ,1904    **Energy Research Abstracts** ,1983    **Radio News** ,1921 Some issues 1943 July 1948 include separately paged and numbered section called Radio electronic engineering edition called Radionics edition in 1943
