Genetics and Heredity Unit Study Guide/Practice Test 2013-2014**Section 1 Cell Division**

What are the two types of cell division that we have discussed in this unit?

1. **Mitosis** 2. **Meiosis**

Complete the following chart:

| Type of cell division | Mitosis | Meiosis |
|--|---|---------------------------------------|
| Cell starts out as a body (somatic) or sex cell? | Somatic cell | Somatic cell |
| Function of this process | To create more somatic cells. Growth and repair of body cells, tissues, and organs. | Production of gametes (egg and sperm) |
| Initial cell is haploid or diploid? | Diploid | Diploid |
| Nucleus divides once or twice? | Once | Twice |
| Number of daughter cells at end of cell division? | 2 | 4 |
| End product is a body (somatic) cell or gamete? | Somatic cells | Gametes |
| End product is diploid or haploid | Diploid | Haploid |
| If there are 3 pairs of homologous chromosomes in the cell at the beginning of cell division, how many chromosomes will be in each cell at the end of cell division? | 6 | 3 |

1. A human body cell contains **23** pairs of **homologous** chromosomes or a total of **46** chromosomes.

****Note: Homologous chromosomes** are pairs of chromosomes in which one chromosome comes from the mother and one comes from the father. Homologous chromosomes are similar but not identical. Each carries the same genes in the same order, but the alleles for each trait may not be the same.

2. What occurs during mitotic cell divisions:

During mitosis and cell division, the chromosomes duplicate and then separate. At the end of mitosis, a new nucleus forms around each new set of chromosomes and then the cell divides in a process called cytokinesis. This creates two new identical daughter cells.

Managing the Adolescent Classroom Glenda Beamon Crawford,2004-04-29 Uncover the secrets of teachers who are recognized as outstanding classroom managers Through fourteen case studies of exemplary teachers Crawford showcases adolescent classroom management at its best Teachers can draw from this rich store of individual tips secrets and procedures and adapt these management solutions immediately Along with these variations on classic elements of success Crawford also provides many new entry points for new and experienced teachers to improve their own management Reflective chapter questions and discussion prompts make this a productive resource for study groups and mentors as well as classroom teachers Managing the Adolescent Classroom demonstrates how to triangulate great management around three essential factors Physical leveraging time space and a structured environment Affective strategies

to promote positive personal and interpersonal development Cognitive use of instructional pace and engagement to motivate behavior and commitment to learning By successfully managing the physical social emotional and academic dimensions of the classroom environment teachers can create an essential foundation for a learning community of young adolescents that will promote relationships belonging and achievement *Resources in Education* ,1992 Serves as an index to Eric reports microform Appraising the Character and Effectiveness of High School Biology Students' Self-directed Study Activities

Robert Wayne Warkentin,1991 **Crossing the threshold** Andreas C. Göransson,2021-02-18 The theory of evolution is considered the unifying theory of biology An accurate understanding of evolution is vital both for the understanding of diverse topics in biology but also for societal issues such as antibiotic resistance or biodiversity In contrast decades of research in science education have revealed that students have difficulties to accurately understand evolutionary processes such as mutation and natural selection The majority of this research relies on a conceptual framework of so called key concepts variation selection inheritance derived from scholarly descriptions of natural selection Recent research suggests that non domain specific concepts such as randomness probability spatial and temporal scales so called threshold concepts are important for evolution understanding in addition to the key concepts Thus many important elements of evolutionary theory are counter intuitive or lie outside direct perception Hence representations such as visualizations models and simulations are considered to be important for teaching and learning evolution While the importance of visualizations is generally acknowledged for science education less is known about how visual design can facilitate students understanding of threshold concepts such as random mutations or spatial scales This thesis uses the Model of Educational Reconstruction MER as the guiding framework for exploring the significance of threshold concepts by analysing the conceptual content of students explanations and extant visualizations of natural selection MER combines scientific content with teaching and learning perspectives for the analysis and design of learning environments Content analysis of visualizations available online showed that most fail to fully represent the basic principles of natural selection variation selection and inheritance Moreover the representational potential of visualizations was seldom used to represent threshold concepts such as randomness in origin of variation Visualizations were also biased to animals as the context of evolution Similarly upper secondary and tertiary students explanations of natural selection were seldom complete in terms of the basic principles and threshold concepts such as randomness were often lacking Especially significant was the almost complete lack of randomness in upper secondary students explanations In addition threshold concepts were context sensitive across the items used bacteria cheetah and salamander for example spatial scale and randomness was significantly more common in responses to the bacteria item compared to the cheetah and salamander items Considering the results from these studies three interactive visualizations were developed evolution of antibiotic resistance and fur colouration in mice The visualization design was conducted iteratively following a Design Based Research approach and evaluated in classroom settings in secondary and

upper secondary Swedish schools. The results showed that visualizations targeting randomness and genetic level events such as mutations can guide students towards a more scientific conception of natural selection. However, there were differences across the visualizations and student samples. In addition, while students often inferred randomness from the visuals, the results showed that integration of randomness into explanations of natural selection may be challenging. Hence, future research should explore the role of guidance and reflection for students' understanding of randomness. The thesis also discusses the role of students' intuitive conceptions in relation to the use of interactive visualizations and how these preconceptions interact with the presented message. By using the theory of frame semantics, framing effects and conceptual integration, students' issues of achieving an accurate understanding of evolution are discussed in relation to the theory of conceptual change. Implications for teaching and learning natural selection as well as visualization design for learning are also discussed. Evolutionsteorin förs ofta fram som biologins förande teori. Vikten av en korrekt och användbar evolutionsfråga har dock ofta betonats inte minst för elevers förstelse. I området om biologins olika delområden men också för att fatta beslut i samhället gör som exempelvis antibiotikaresistens. Många av de centrala delarna av evolutionsteorin är kontraintuitiva eller abstrakta och decennier av forskning har visat att elever har svårigheter att förstå evolutionens processer som mutation och naturligt urval. Representationer som visualiseringar, modeller och simuleringar är dock också viktiga för att ge elever direkta erfarenheter av evolutionens processer. Ven om vikten av visualiseringar är allmänt accepterad inom naturvetenskapsundervisning, så det mindre är hur visualiseringars utformning specifikt bidrar till att utveckla elevers förstelse av vetenskapliga fenomen som evolution. Dessutom har forskningen på elevers evolutionsfrågor till stor del fokuserat på s.kallade nyckelbegrepp: variation, selektion och arv som har lett till vetenskapliga beskrivningar av evolutionsteorin. Dessa begrepp antas vara användbara men också tillräckliga för elevers evolutionsfrågor. Dock har vikten av icke domänspecifika begrepp kopplade till evolutionsteorin som slump, sannolikhet, spatial och temporala skalar och s.kallade trådskelbegrepp inte undersökts i någon huvudsak. Den här avhandlingen använder Model of Educational Reconstruction för att utforska betydelsen av trådskelbegrepp för evolutionsfrågor. Med utgångspunkt i den vetenskapliga beskrivningen och historiken undersöks förkomsten av trådskelbegrepp i befintliga visualiseringar först och sedan samt elevers förklaringar för att formulera designprinciper för interaktiva visualiseringar av evolution. Dessutom beskrivs utvecklingen av ett antal interaktiva visualiseringar samt undersökningarna av deras potentiella användning i klassrumsmiljöer. Avhandlingen diskuterar även betydelsen av elevers intuitiva förstelärlingar i relation till användandet av interaktiva visualiseringar och hur dessa förstelärlingar interagerar med det presenterade budskapet. Genom användning av ramsemantisk teori inklusive framingeffekter och blandteori diskuteras elevers svårigheter och utveckling av en vetenskaplig evolutionsfråga i relation till tidigare teorier om begreppsförändring. Konsekvenser av ramsemantisk teori och framingeffekter i visuella medier diskuteras även i relation till visuell design först och sedan.
