## **Natural Gas Pipeline Repair:**

**Oil and Gas Pipelines** R. Winston Revie, 2015-04-20 A comprehensive and detailed reference guide on the integrity and safety of oil and gas pipelines both onshore and offshore. Covers a wide variety of topics including design, pipe manufacture, pipeline welding, human factors, residual stresses, mechanical damage, fracture and corrosion protection, inspection and monitoring, pipeline cleaning, direct assessment, repair, risk management and abandonment. Links modern and vintage practices to help integrity engineers better understand their system and apply up to date technology to older infrastructure. Includes case histories with examples of solutions to complex problems related to pipeline integrity. Includes chapters on stress based and strain based design, the latter being a novel type of design that has only recently been investigated by designer firms and regulators. Provides information to help those who are responsible to establish procedures for ensuring pipeline integrity and safety.

## **INTERNAL REPAIR OF GAS PIPELINES SURVEY OF OPERATOR EXPERIENCE AND INDUSTRY NEEDS**

**REPORT.** , 2004 A repair method that can be applied from the inside of a gas transmission pipeline i.e. a trenchless repair is an attractive alternative to conventional repair methods since the need to excavate the pipeline is precluded. This is particularly true for pipelines in environmentally sensitive and highly populated areas. The objectives of the project are to evaluate, develop, demonstrate and validate internal repair methods for pipelines, develop a functional specification for an internal pipeline repair system and prepare a recommended practice for internal repair of pipelines. The purpose of this survey is to better understand the needs and performance requirements of the natural gas transmission industry regarding internal repair. A total of fifty six surveys were sent to pipeline operators. A total of twenty completed surveys were returned representing a 36% response rate which is considered very good given the fact that tailored surveys are known in the marketing industry to seldom attract more than a 10% response rate. The twenty survey responses produced the following principal conclusions:

- 1 Use of internal weld repair is most attractive for river crossings under other bodies of water e.g. lakes and swamps in difficult soil conditions under highways, under congested intersections and under railway crossings. All these areas tend to be very difficult and very costly if and where conventional excavated repairs may be currently used.
- 2 Internal pipe repair offers a strong potential advantage to the high cost of horizontal direct drilling (HDD) when a new bore must be created to solve a leak or other problem in a water river crossing.
- 3 The typical travel distances required can be divided into three distinct groups up to 305 m (1 000 ft), between 305 m and 610 m (1 000 ft and 2 000 ft) and beyond 914 m (3 000 ft). In concept these groups require pig based systems, despoiled umbilical systems could be considered for the first two groups. For the last group a self propelled system with an onboard self contained power and welding system is required.
- 4 Pipe size range requirements range from 50.8 mm (2 in) through 1219.2 mm (48 in) in diameter. The most common size range for 80% to 90%

of operators surveyed is 508 mm to 762 mm 20 in to 30 in diameter with 95% using 558 8 mm 22 in diameter pipe      *Coos County Natural Gas Pipeline ,2002      Reauthorization of the Natural Gas Pipeline Safety Act and the Hazardous Liquid Pipeline Safety Act* United States. *Fossil Energy Update ,1980      The Testing and Repair of Polyethylene Natural Gas Distribution Pipe* John Hunt,2004 With the dominance of polyethylene as the building material for America s natural gas distribution system and a growing demand for natural gas there exists and ever increasing need for improved methods of repairing damaged natural gas distribution pipe This paper serves as the ground work for a multi part study seeking to address this need by working towards the development of a polyethylene pipe repair patch that can easily be applied to damaged sections of pipe with minimal labor The first part of the study addresses the stresses present in a section of natural gas pipe and the criteria demanded of a successful patch adhesive Tensile testing techniques are used to evaluate potential adhesives and finite element modeling is used to determine the maximum expected stresses experienced by the patch on a section of polyethylene pipe The second part of the study addresses the need for the section of pipe to maintain its structural integrity after the application of the patch and goes into the testing required to validate polyethylene gas pipe that has been damaged and repaired using the polyethylene pipe repair patch      *Pipeline Engineering ,1995      Oil and Gas Pipeline Fundamentals*
